

# Water Resources Management – Challenges ... and the use of models

Kees Bons  
Team leader

Strategic Basin Planning for Ganga River Basin in India

# Content

1. A changing world – implications for water management
2. Integrated Water Resources Management
3. Why use of models in IWRM
4. Example of Yellow River, China

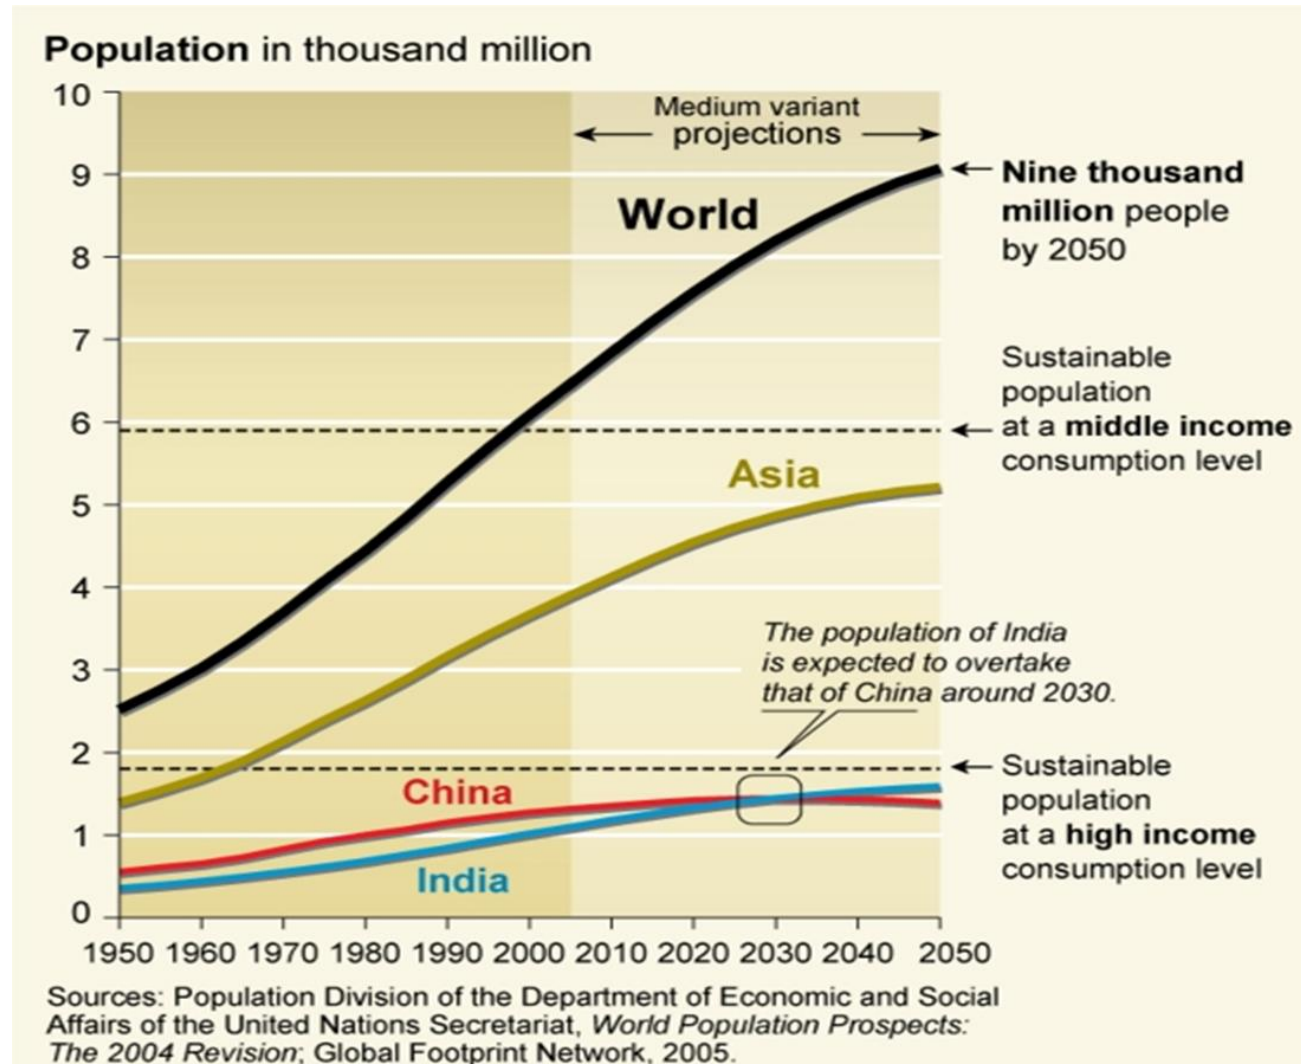

# 1. Our fresh water – drivers for change

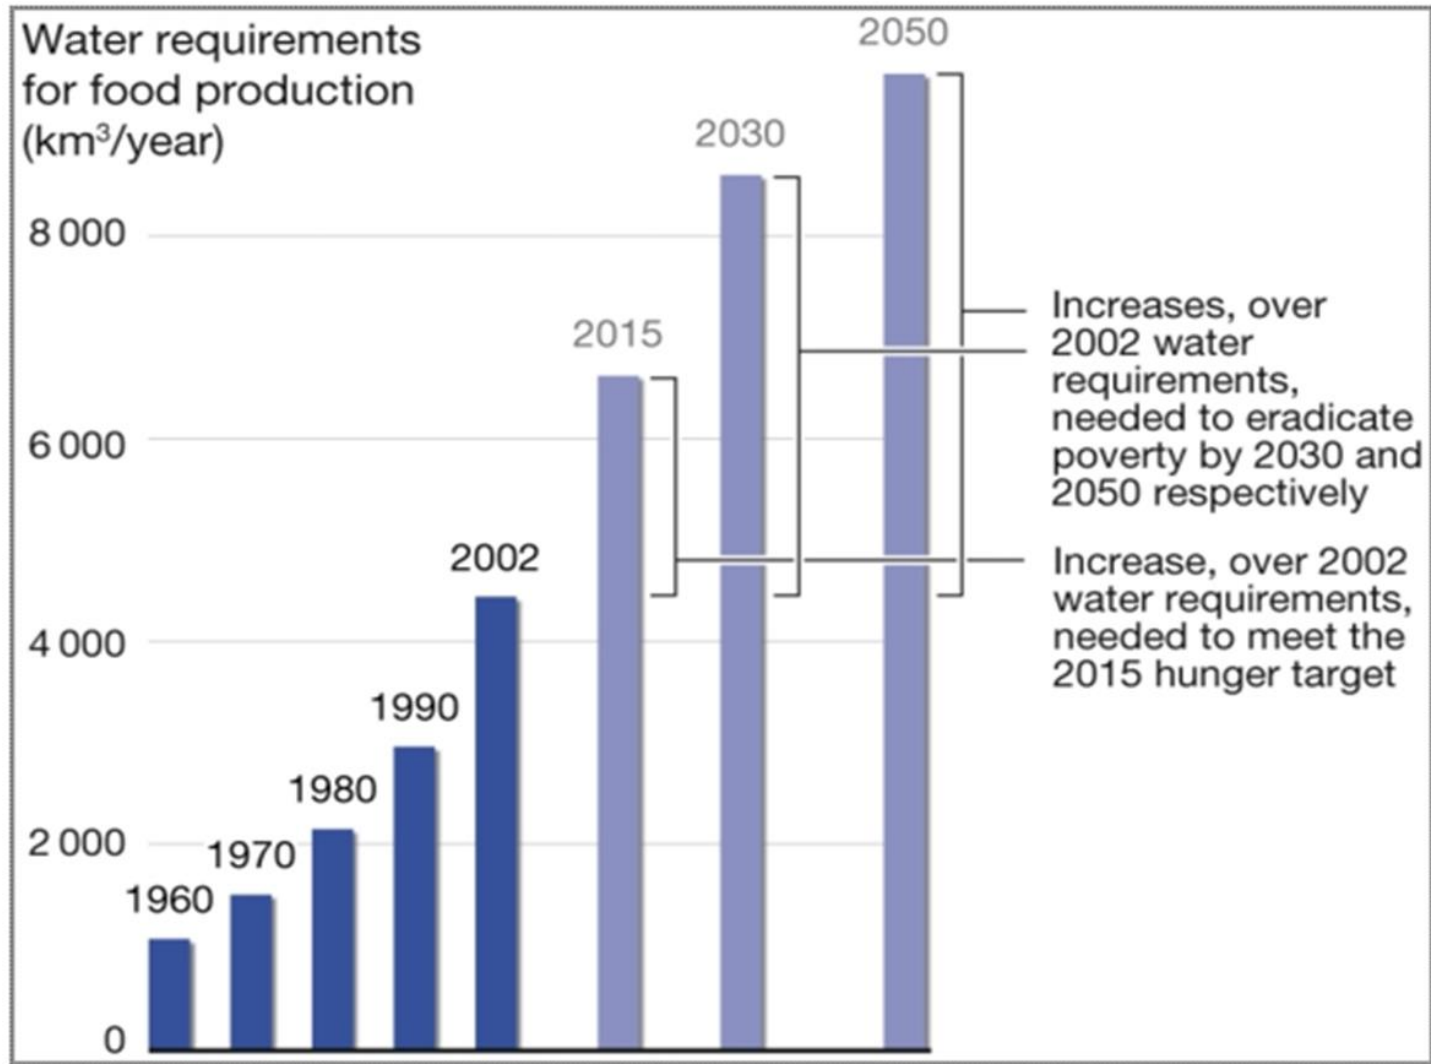

- Energy, Food, Water Demands
  - increasing
- Supplies
  - more variable and extreme
- Water
  - more contaminated
- Environment, Ecosystems
  - more concern
- Future uncertainties
  - increasing
- Why
  - climate? **PEOPLE** ?

# A more populous world

# A hungrier world 1960 - 2050

# Demand for more.....

.....or less  
dams

# Demand for more hydropower

# A more prosperous world

changes in life styles

**Each 150 g. hamburger  
requires 2400 liters of  
water.**

**As people become wealthier their diets change.**

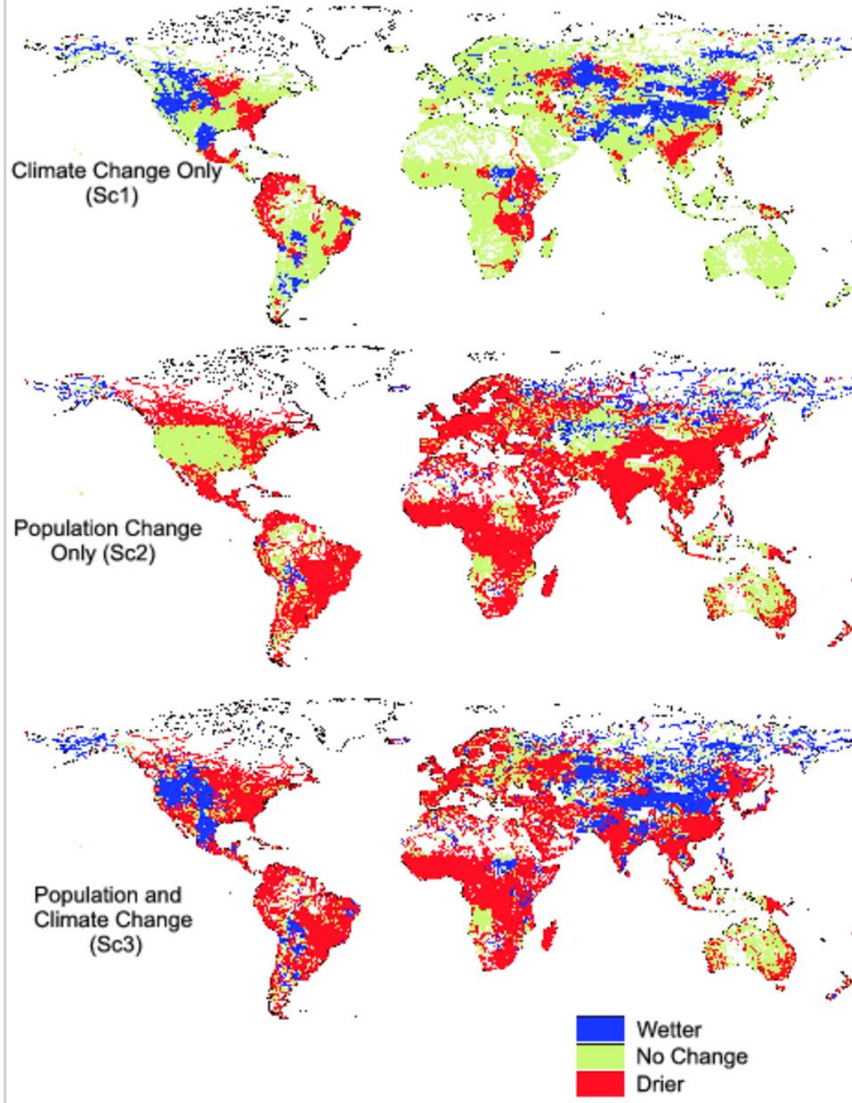

**They consume more meat and dairy products.**

**They take more energy and water to produce than vegetable diets.**

**Prosperous people use more energy to maintain their lifestyle.**

## Relative Change in Demand per Discharge

## Water Stress Changes to 2025

- **80% of future stress from population & development, not climate change!**
- **Correct Priorities?**  
(E.g. 85% US global change research funding goes to climate and carbon)

# So ...

- Our changing world forces us to take action
  - we have improve our water management
- Water has become a scarce resource
  - easy solutions are not available anymore
  - developing the system for one user might harm another (downstream) user
- It is not just a technical and economic challenge anymore
  - strong social and environmental dimensions
  - transboundary issues
  - politics and governance issues dominate
  - etc
- Need for Integrated Water Resource Management (IWRM)

## 2. IWRM

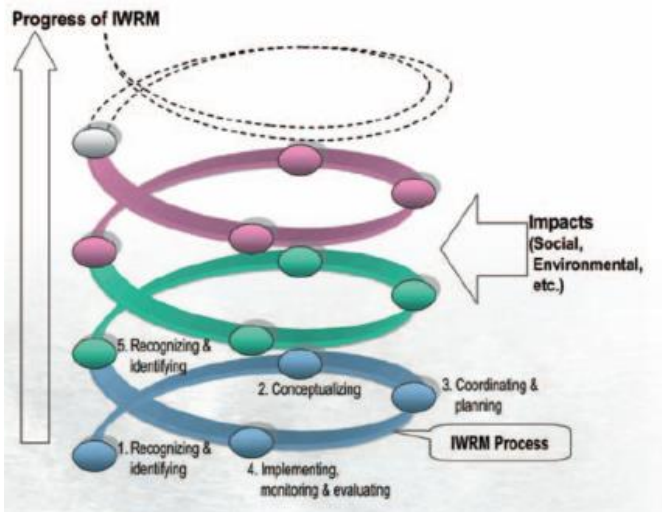

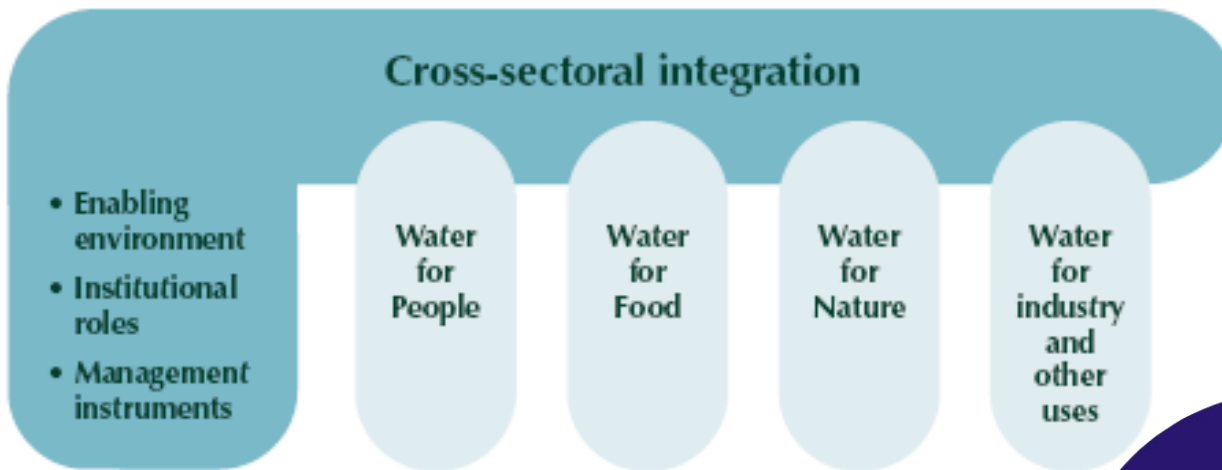

IWRM is a **process** which promotes the coordinated development and management of water, land and related resources, in order to maximise the resultant **economic and social welfare** in an equitable manner without compromising the **sustainability of vital ecosystems.**

(GWP, 2000)

# IWRM - integrating the use functions

## 3. Why use models in IWRM ?

- We want to manage our water resources systems
  - implement structural measures (reservoirs, river training works, irrigation areas, waste water treatment, etc.)
  - distribute the water to the various users
  - warn the stakeholders for floods and droughts
  - etc.
- But ...
  - which measures to take ? and when?
  - what will be the effect of these measures ?
- Models help us to:
  - understand how the system works
  - helps us to quantify the effects
    - do they help us in achieving our objectives?
- Models are just tools – very useful but not magic

# 4. Example: Yellow River

Length: 5,464 km  
Area: 795,000 km<sup>2</sup>  
Population: 107 million  
Average flow: 57 km<sup>3</sup>/year

# 1. Background

# IWRM

Toward  
IWRM

Water pollution /  
environmental  
deterioration

Suspended  
meander  
river

Fragile  
environment/  
High sediment  
concentration  
flow

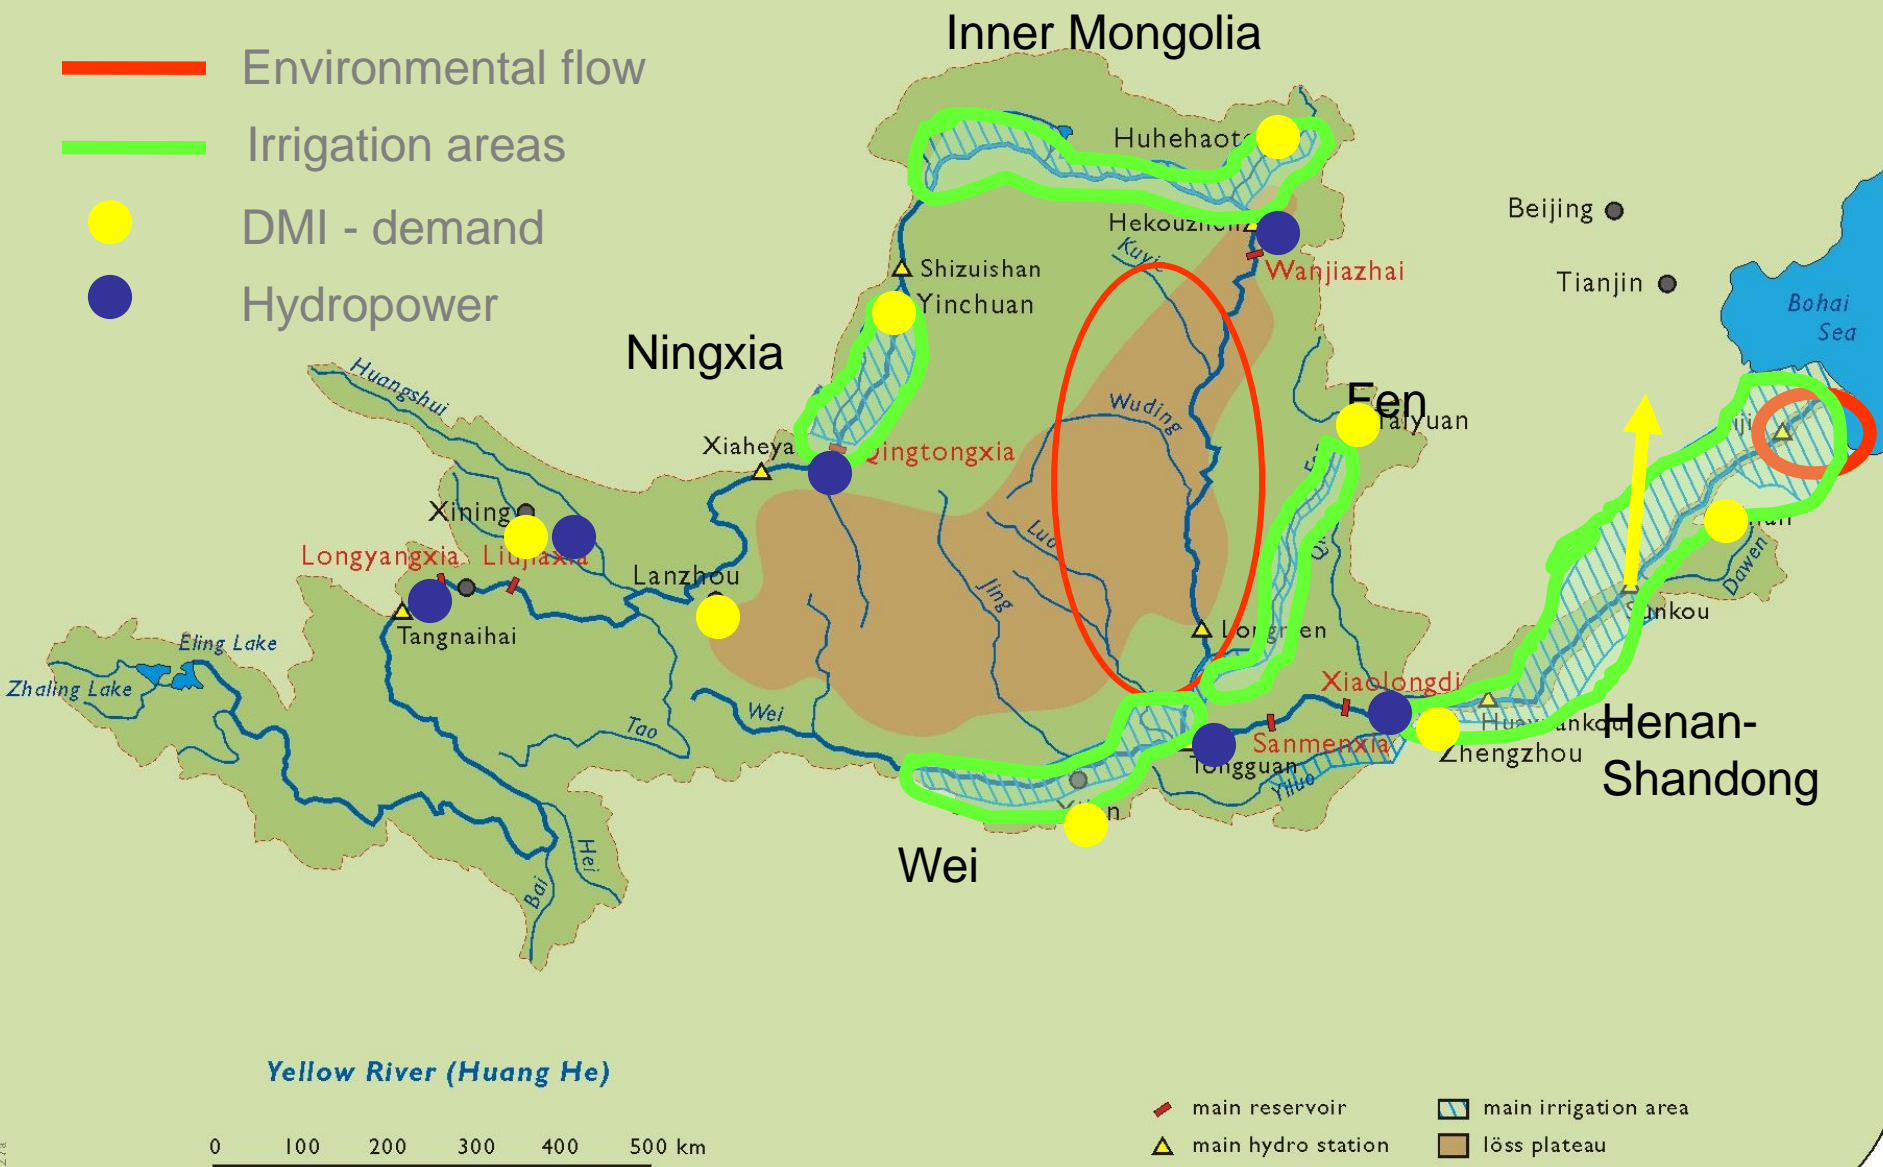

Internal factors

| Year | Zero flow days | Year | Zero flow days |
|------|----------------|------|----------------|
| 1972 | 19             | 1988 | 5              |
| 1974 | 20             | 1989 | 24             |
| 1975 | 13             | 1991 | 16             |
| 1976 | 8              | 1992 | 83             |
| 1978 | 5              | 1993 | 60             |
| 1979 | 21             | 1994 | 74             |
| 1980 | 8              | 1995 | 122            |
| 1981 | 36             | 1996 | 136            |
| 1982 | 10             | 1997 | 226            |
| 1983 | 5              | 1998 | 142            |
| 1987 | 17             | 1999 | 42             |

# 2. Water allocation in the YRB

Balancing of interests

- Environmental flow
- Irrigation areas
- DMI - demand
- Hydropower

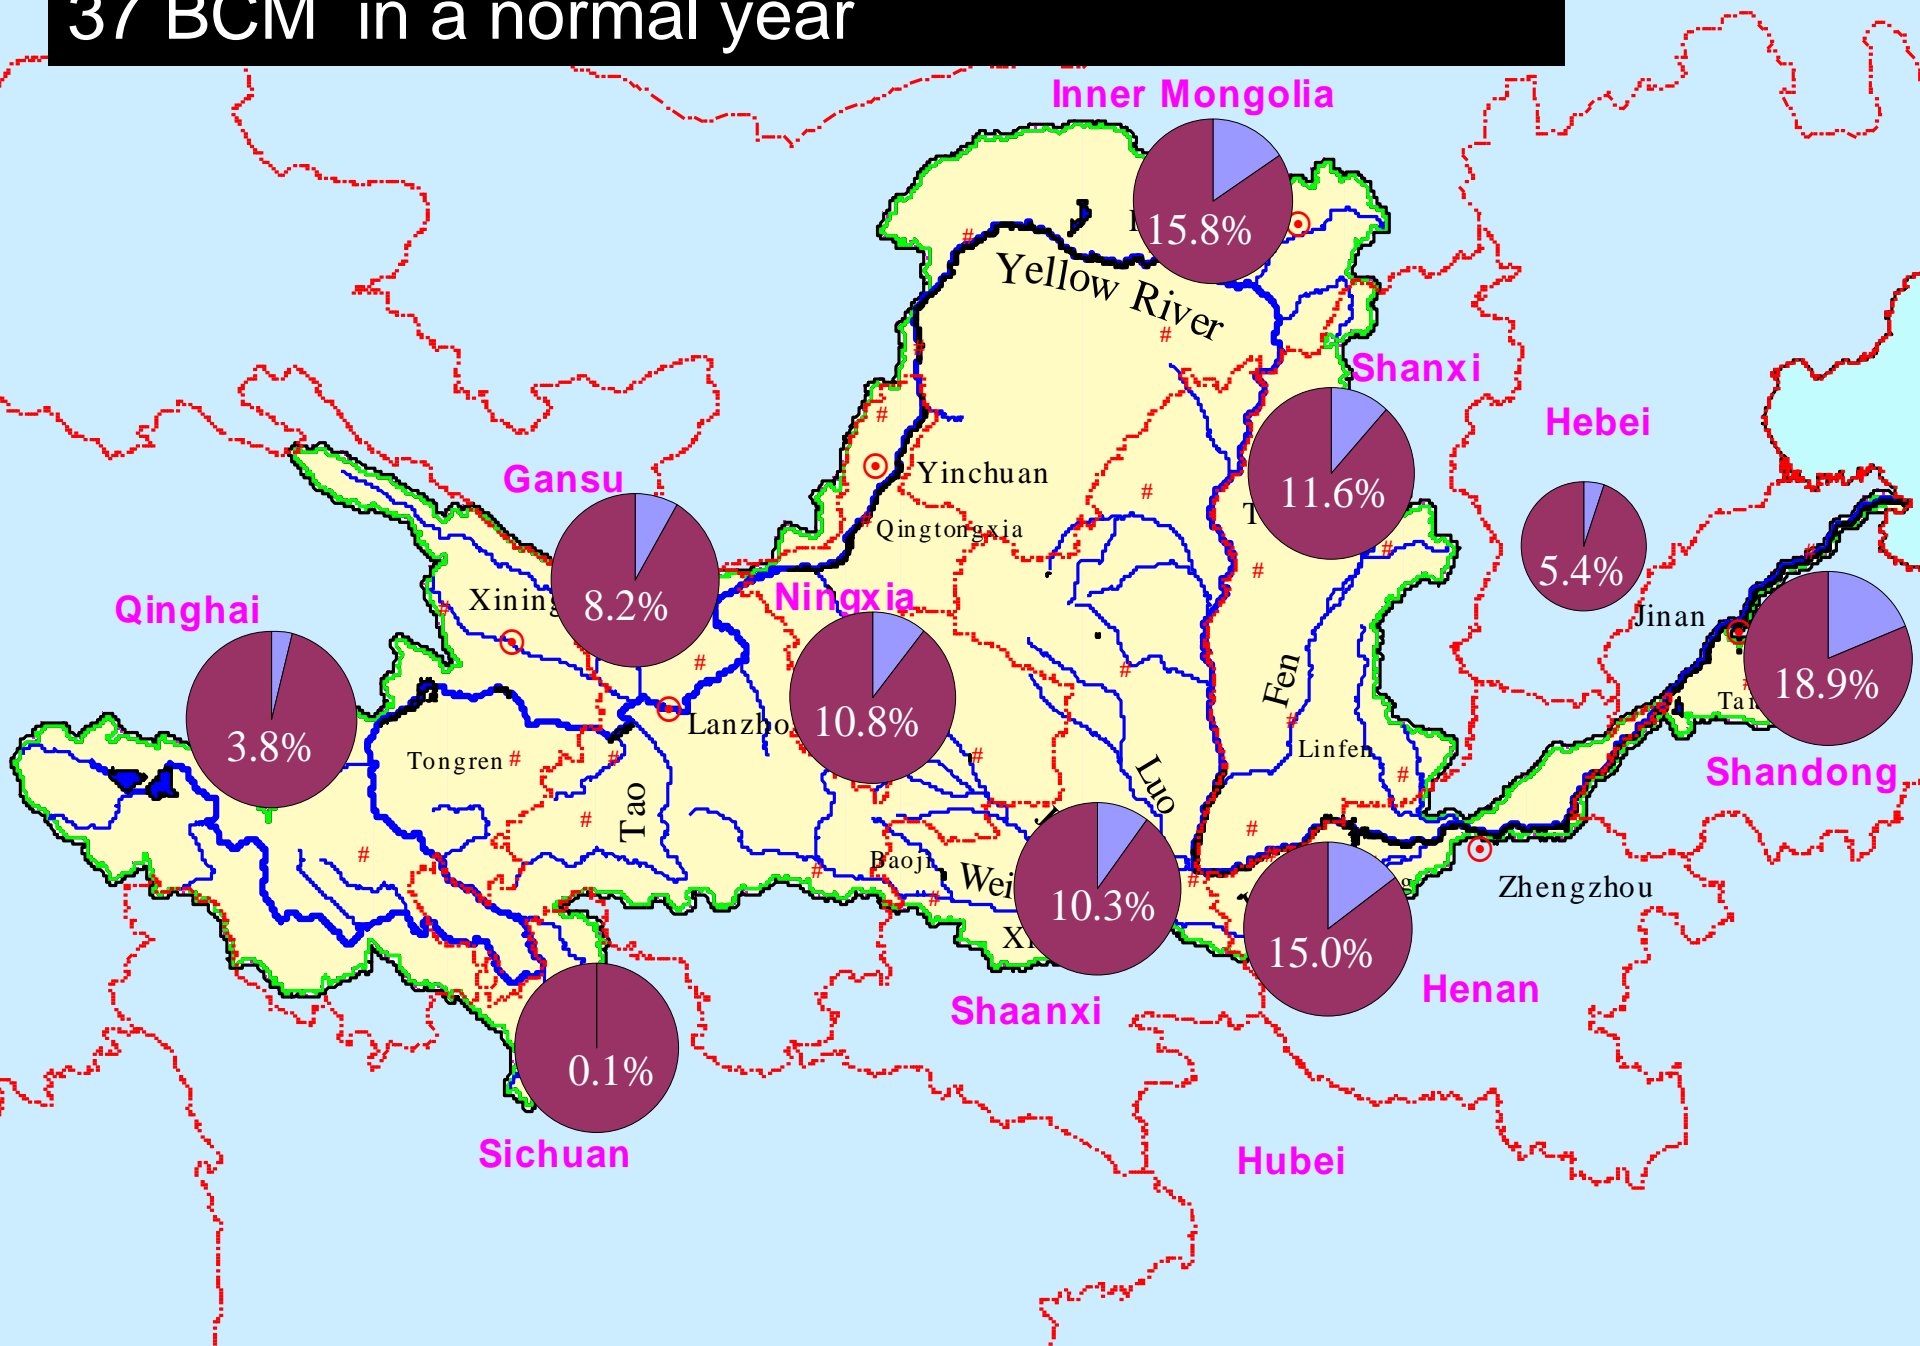

# Inter-provincial transboundary

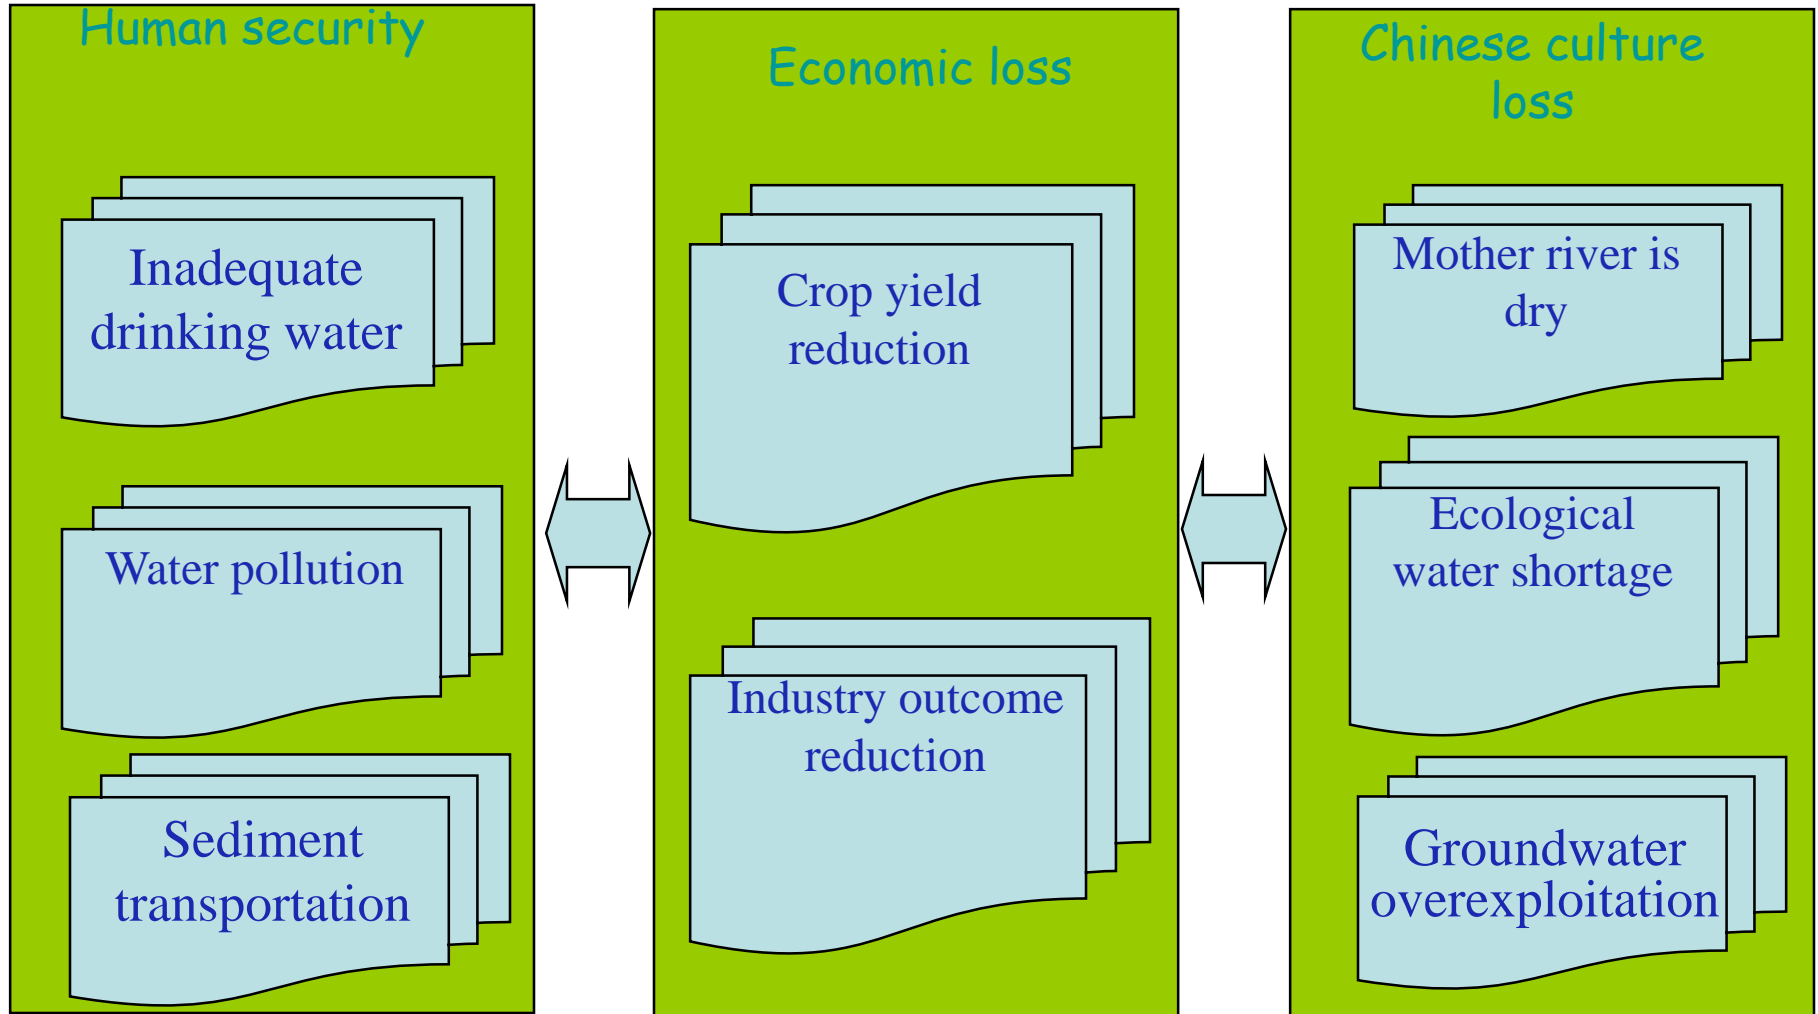

# 1987 inter-provincial water allocation scheme : 37 BCM in a normal year

# water shortage consequences . . .

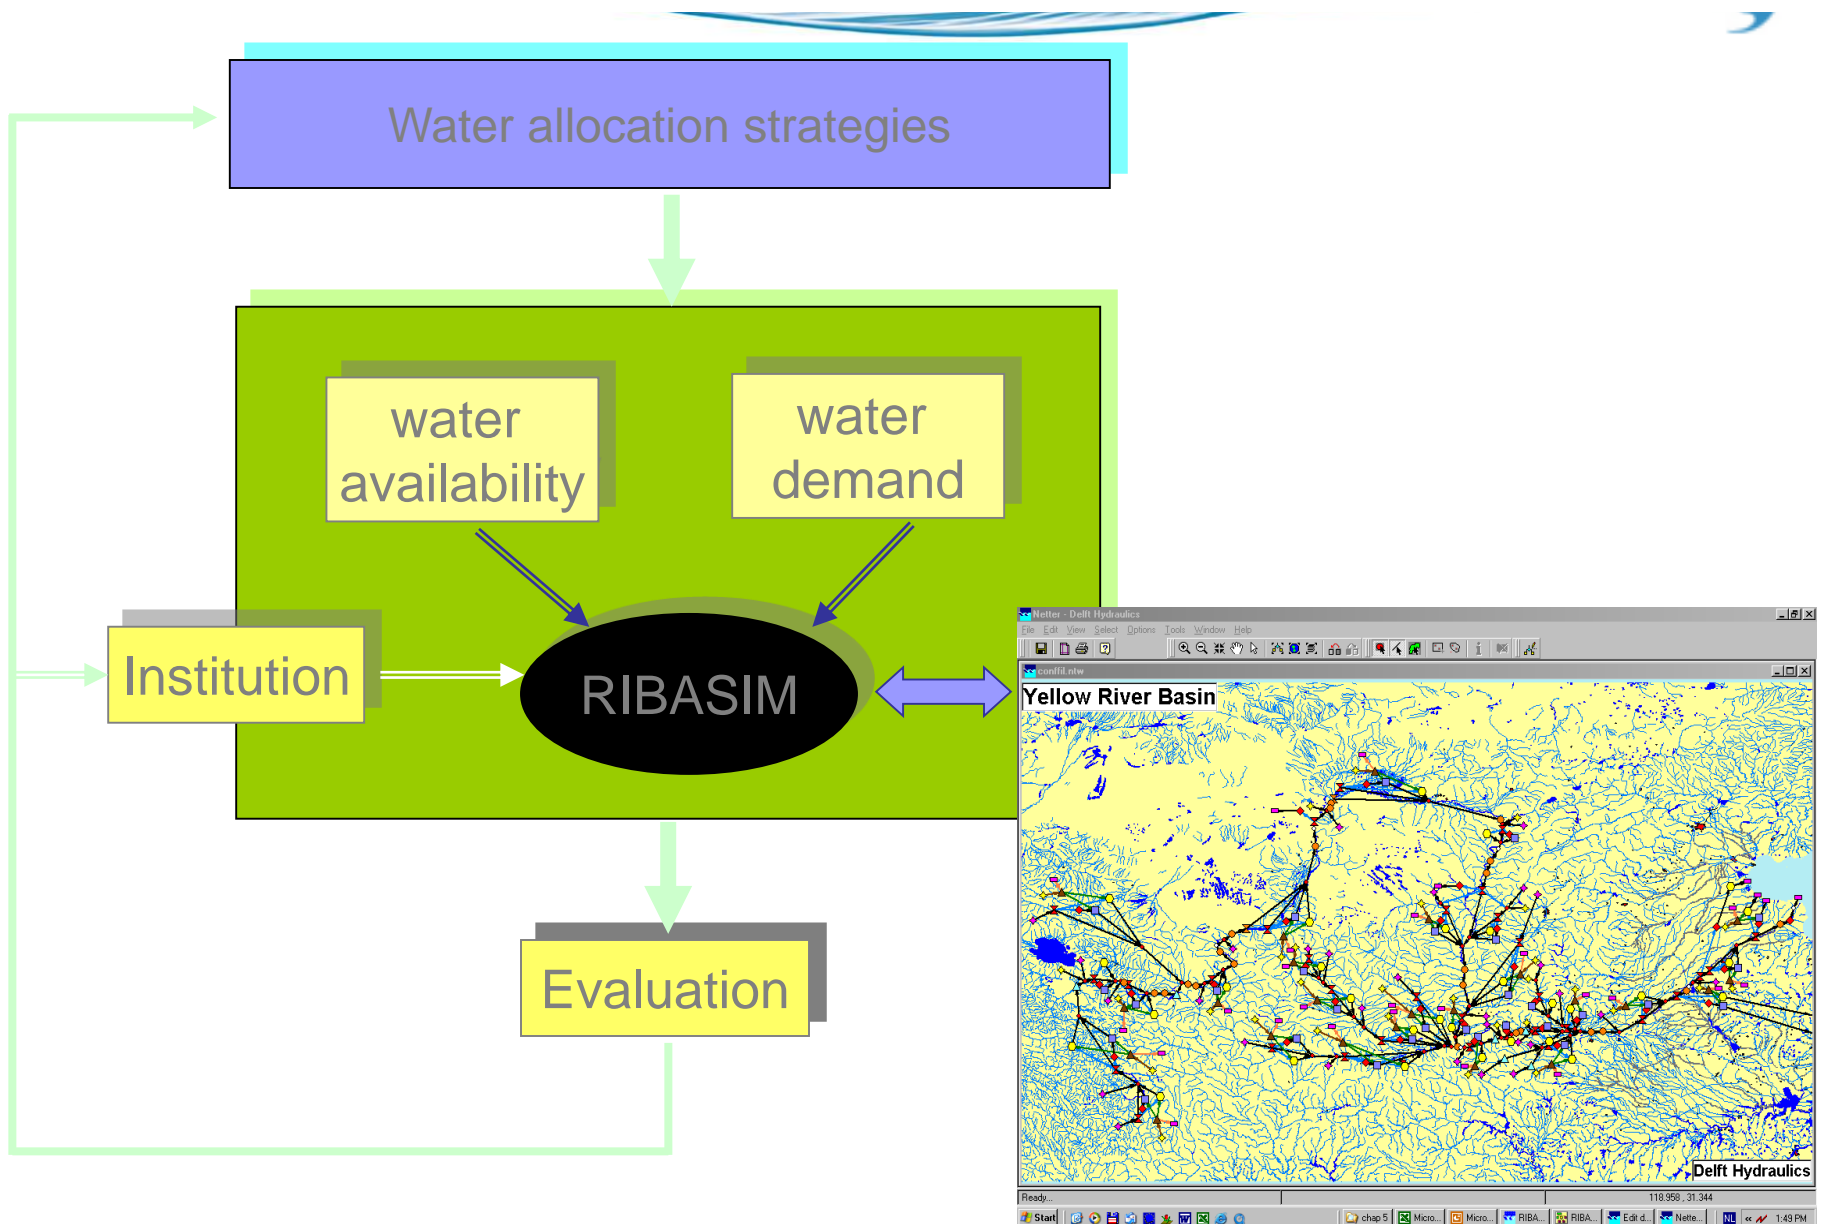

## Need for a new strategy

- Since 1999, the 1987 scheme has been put into practice by YR water conservancy commission (YRCC) and **zero flow** is indeed prevented.
- However, differences of **opinions** and the **huge gap** between water supply and demand results in severe **disputes** among / within provinces and across water sectors.
- A more rational water allocation scheme is needed  
=> **Who** should get **how much** water, **when**, and **how** and **why**?????

# Models help identify the alternative options

Schematization of the YRB water

# Establishment of strategies water allocation

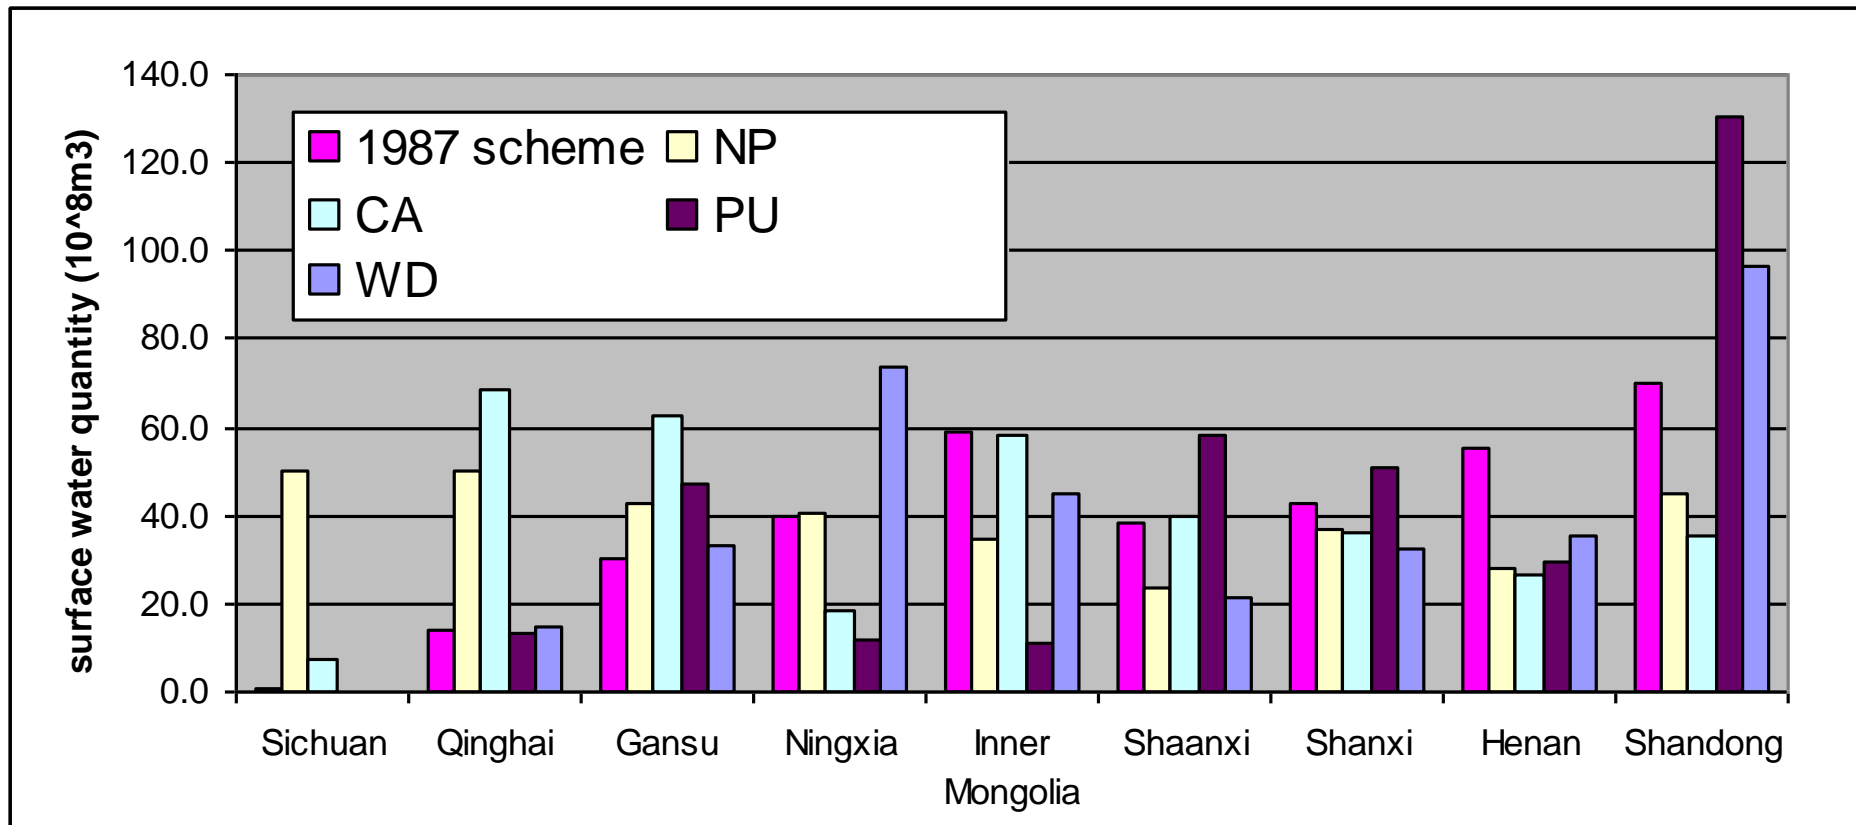

- 4 types of 'equity' strategies
  - NP: **N**umber of **P**rovinces
  - CA: **C**atchment **A**rea
  - PU: **P**opUlation
  - WD: **W**ater **D**emand
- Combined with 6 different reserved water which is out of negotiation
- In total, 24 combinations of water shares for the 9 provinces in the YRB

6 types of reserved water

| Components                  | 1 | 1E | 2 | 2E | 3 | 3E |
|-----------------------------|---|----|---|----|---|----|
| Domestic & municipal demand |   |    |   |    |   |    |
| Industry demand             |   |    |   |    |   |    |
| Enviromental low flow       |   |    |   |    |   |    |

# Example results of water allocation case '1E'

# Example results of water allocation for case '1E'

| Province       | 1987 scheme | NP    | CA    | PU    | WD    |
|----------------|-------------|-------|-------|-------|-------|
| Sichuan        | 0.4         | 50.3  | 7.5   | 0.2   | 0.1   |
| Qinghai        | 14.1        | 49.8  | 68.5  | 13.2  | 14.6  |
| Gansu          | 30.4        | 42.8  | 62.4  | 47.0  | 33.1  |
| Ningxia        | 40.0        | 40.7  | 18.2  | 12.0  | 73.8  |
| Inner Mongolia | 58.6        | 34.9  | 58.2  | 11.1  | 45.0  |
| Shaanxi        | 38.0        | 23.5  | 40.0  | 58.4  | 21.5  |
| Shanxi         | 43.1        | 36.8  | 36.0  | 50.5  | 32.4  |
| Henan          | 55.4        | 28.2  | 26.2  | 29.5  | 35.2  |
| Shandong       | 70.0        | 44.9  | 35.2  | 130.2 | 96.4  |
| basin          | 350.0       | 352.1 | 352.1 | 352.1 | 352.1 |

# Conclusions and recommendations

- As demand grows, issues on water shortage and quality will escalate among states and across water sectors in the in future.
- Integrated Water Resources Management, involving all stakeholders, will help find the best approach (from different perspectives, there may be more than one 'best' approach)
- Models are very useful tools to provide transparent insight in the quantitative effects of interventions and measures, supporting decision making.
